compcode1.github.io/declarative-zero-trust-synthesis-engine

PROFESSIONAL SUMMARY

Microsoft Certified Identity and Access Administrator (SC-300) and Enterprise Cloud Security Engineer specializing in Microsoft Entra ID workload identity federation.

Recognizing unmanaged machine identities and static credentials as critical vulnerabilities in modern cloud architecture, I engineered and continuously manage the **Declarative Zero-Trust Synthesis Engine**—a proprietary software product showcased at compcode1.github.io/declarative-zero-trust-synthesis-engine.

This platform transforms unconstrained, probabilistic Generative AI into a deterministic orchestration framework. By enforcing rigid security directives, I leverage this platform to safely automate passwordless provisioning, instantly generate cryptographic proof of governance, and seamlessly scale zero-trust architecture.

TECHNICAL SKILLS & COMPETENCIES

- **Identity & Access Management:** Microsoft Entra ID, Workload Identity Federation (WIF), OpenID Connect (OIDC), Service Principals, Managed Identities, Privileged Identity Management (PIM).
- **Zero Trust & Cloud Security:** Zero Trust Architecture, Data-Plane Role-Based Access Control (RBAC), Conditional Access, Continuous Access Evaluation (CAE), Microsoft Entra ID Protection, Azure Key Vault Governance.
- **Infrastructure as Code (IaC) & Automation:** Terraform, Azure Bicep, Microsoft Graph API, Azure CLI.
- **DevOps & Scripting:** GitHub Actions CI/CD pipelines, Python, PowerShell.
- **Generative AI Orchestration:** Prompt-Driven Execution Pipelines, Deterministic AI Guardrails, Closed-Loop Software Engineering.
- **Diagnostic Auditing & Security Operations:** Kusto Query Language (KQL), Azure Log Analytics, OIDC Telemetry Tracing, "Silent 403" Diagnostics.
- **Governance & Compliance:** Identity Governance (Access Reviews & Entitlement Management), NIST SP 800-207 (Zero Trust), SOC 2 & ISO Readiness, Identity Architecture Ledger (IAL), Audit Results Ledger (ARL)

PROFESSIONAL EXPERIENCE

Intelligent Architecture | Sunnyvale, CA *Enterprise Identity Architect / Systems Engineer* | May 2024 – Present

Engineered and deployed the **Declarative Zero-Trust Synthesis Engine**, a proprietary closed-loop software product designed to force probabilistic AI models to execute deterministically, specifically targeting the complex lifecycle and governance of non-human enterprise identities.

- **Strategic Architecture & Threat Mitigation:** Continuously analyze evolving attack vectors to deliberately refine a deployment framework that meets the foundational industry need for machine identity hardening and automated secrets eradication.
- **Product Lifecycle & Continuous Optimization:** Drive the ongoing lifecycle management of the platform, iteratively tuning AI governance directives (the "Governance Anchor") to expand its capability index and address emerging Microsoft Entra ID integrations.
- **AI Orchestration & Infrastructure Automation:** Developed a prompt-driven execution pipeline governed by rigid Human-in-the-Loop (HITL) validation gates, translating strategic inputs and strict GitHub Subject Claims into secure, environment-agnostic Infrastructure as Code (IaC) without manual configuration drift.
- **Zero-Trust Identity Federation:** Programmed the engine to automate the deployment of passwordless OpenID Connect (OIDC) workload federations, eliminating the attack surface of long-lived static secrets and binding identities strictly to least-privilege data-plane controls.
- **Automated Compliance Validation:** Programmed the software engine to automatically generate the Identity Architecture Ledger (IAL), instantly translating infrastructure-as-code into compliance-as-code by natively capturing exact deployment variables and hardcoding boundaries to prevent the creation of unmonitored "ghost" identities.
- **Forensic Audit & Verification:** Engineered a two-stage verification framework to overcome Log Analytics ingestion latency. The platform first queries Microsoft Graph for immediate data-plane validation, then generates hardened KQL to deep-scan asynchronous Azure telemetry—compiling the Audit Results Ledger (ARL) with mathematical proof of Coordinates, Characters, Clock, and Plane.
- **Modular Enterprise Scaling:** Designed a structured **Control Plane Capability Index** that maps 35 core Microsoft Entra capabilities across 7 functional domains, enabling the engineer to seamlessly scale advanced access controls on top of the hardened identity core.

PROFESSIONAL CERTIFICATIONS

Microsoft Certified: SC-300 | **CompTIA:** CySA+ & Security+ ce

Python Institute: PCAP | **Dataquest:** Data Engineering Professional
